Gum disease occurs more often in men. This may be because men are less likely to go to the dentist and have a higher rate of dental plaque, tartar, and bleeding.

Men with signs of gum disease have higher levels of Prostate-Specific Antigen present in prostate cancer.

Bacteria that cause gum disease are also found to increase cholesterol and inflammation in heart arteries.

Men with a history of gum disease are 14% more likely to develop cancer than men with healthy gums.

53% of male patients with Erectile Dysfunction (ED) also suffer from severe gum disease.
